The presence of a stored code P0725 means that the powertrain control module (PCM) has detected a circuit malfunction with the engine speed sensor input signal. The engine speed input sensor is sometimes called the transmission input speed sensor and the input speed sensor. This type of code may be caused by a mechanical problem or an electrical problem. The engine speed input speed sensor is usually inserted through the transmission case, near the front of the input shaft.

P0725 Engine Speed Input Circuit Malfunction

A speed sensor will not pass the reasonableness test if there is no signal at all from that sensor when a signal should be present. NOTE: If turbine speed is below 150 rpm when output speed is below 100 rpm and engine speed is above 400rpm. Neutral Very Low (NVL) is commanded when N (Neutral) is the range selected.

The first is known as the input shaft speed (ISS) sensor. As described, this sensor is used to monitor the speed of the transmission's input shaft. The other sensor is the output shaft speed (OSS) sensor. If either of these two sensors falls out of alignment or experiences electrical issues, it impacts the operation of the entire transmission.

Symptoms of a Bad or Failing Transmission Speed Sensor ...

D-1 and D-2 simply are priority codes for the transmission. Diagnostic codes consist of a main code and a sub code. In your case D-1 is first priority with 22 the main code and 14 being the sub code. Same with D-2, 25= main code, 11= sub code. So, in your case D-1, 22, 14 means Priority 1, 22-14 refers to a failure in the engine speed sensor.
