Cycle | Earth Science

What is different about the phosphorous cycle as compared to the water, carbon, and nitrogen cycles? The atmosphere is not involved. For phosphate to leave the organic environment, there must be a process through which once-submerged sedimentary rock rich in phosphate is exposed because of the movement of

Majors II

The water cycle drives other cycles. The water cycle is important in itself, and patterns of water cycling and rainfall have major effects on Earth's ecosystems. However, rainfall and surface runoff also play important roles in the cycling of various elements. These include carbon, nitrogen, phosphorus,
